RE: Evaluation of GO18-223 Frit Applied to B33 Glass (Borofloat) – UPDATE

This document has been updated to include results based on building small assemblies consisting to a top plate, bottom plate and side walls, using B33 glass and G018-223 Frit. In addition, a sandwich assembly was made, consisting of a silver coated B33 slide, with a top plate frit bonded to the silver. The sandwich remained intact following the frit bonding. Refer to Page 24 for these additional updates.

RE: Initial Evaluation of GO18-223 Frit Applied to B33 Glass (Borofloat)

These trials were initiated around February 3d, and still remain a work-in-progress.

samples as Figure 18)

The samples shown in Figure 18 and 19 were given the ‘binder burn-out’ and “pre-glaze” heat treatment on Friday, February 19<sup>th</sup>. Corresponding top and bottom plates were also prepared. I had hoped to prepare full ‘sandwich constructions’ on the following Monday, but have not been able to follow-through due to illness.

March 26, 2010 - This section includes results based on building small assemblies consisting to a top plate, bottom plate and side walls, using B33 glass and G018-223 Frit. In addition, a sandwich assembly was made, consisting of a silver coated B33 slide, with a top plate frit bonded to the silver. The sandwich remained intact following the frit bonding

Figure 20 - This photo shows the frit after being fired to 'pre-glaze' it. Note the high reflectance of the frit, which shows that it is 'glassy'.

Figure 28 - This photo shows the same sample as the previous figure, with different lighting.

It is noteworthy that the B33-Silver Coating –Frit-B33 sandwich fused without any evidence of fracture. This seems to be at odds with recent observations from similar trials at Argonne. The samples shown in Figures 27 and 28 will be cross-sections and polished to allow microscopic inspection of the frit bond.
